

What is ODBC CONNECT?

ODBC Connect allows you to use external data that currently resides in another application for use in creating/maintaining postage statements.

There are a number of advantages to using external data in WBI products, including:

- **Data coordination** - Ensures that statement is for a job that exists in another system. Any data that is brought in from the DAT-MAIL or Post Master statement files will be associated with valid job information and job numbers - in real time!
- **Time Savings by reducing data entry** - You no longer have to maintain separate Job, Client and other files inside Post Master or DAT-MAIL programs.
- **Special benefits for DAT-MAIL Users** - Enhances ability of DAT-MAIL to automatically generate statements, saving time and improving accuracy. If both external job and client tables are mapped, DAT-MAIL can associate the correct client with each statement automatically via the job number.

USING ODBC CONNECT

Enable and map external data tables for use in your DAT-MAIL and Post Master mailing statements.

When you press the "Job Lookup" button on the statement entry or at statement generation in DAT-MAIL, the listing of jobs that are displayed is from the external data source.

If your job and client tables are linked, and you select a Job, all attached information such as the Client will also be pulled in automatically.

When a statement is saved, the data from the external tables is updated to DAT-MAIL or Post Master's own database files for use in many valuable reports that are available.
