TagMaster Features and Details

Tray and Sack Tag Printing

Mailers can use either continuous feed thermal forms with a thermal printer, or cut sheet tags with a laser printer. Thermal printing of tags is a superior method for typical on-demand applications since these tags can be produced in a "one-up" manner as needed.

There are a number of applications where "batch printing" of tags is very efficient such as when you import a Mail.dat file and print (or reprint) a number of tags at once. In this case, the laser printed tags work extremely well. Thanks to TagMaster's sophisticated printing capabilities, you can also use the laser printer to print tags on demand! You also have the ability to fill a page of tags to avoid wasting your valuable tag stock.

Internet Updates - Keeping Your Data Current!

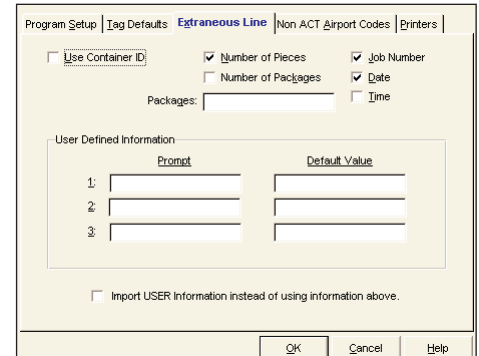

The United States Postal Service® is updating the Labeling Lists and Destination Database more than ever. Keep pace with TagMaster and Internet Updates. Download and install the latest USPS® label files and program updates as often as required, quickly and easily.

Technical Specifications

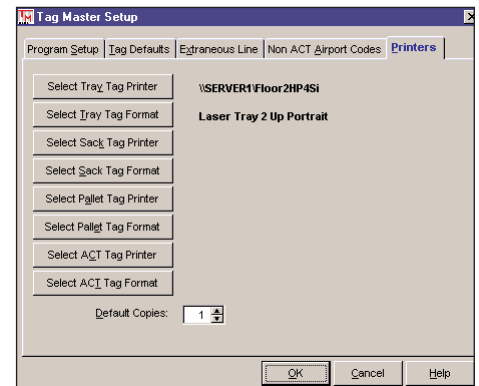

TagMaster runs on most Windows systems. It prints one or two-up thermal tag stock, continuous feed thermal stock or cut sheet laser tag stock. TagMaster is easily downloadable from Window Book's web site, www.windowbook.com.

Printer Compatibility

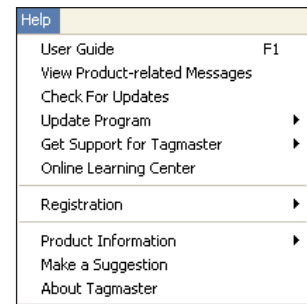

There are many ways to print your tags, depending on what type of printer you are using. If you are using a laser or ink jet printer, you will likely batch print groups of tags to reduce tag stock waste. TagMaster supports all Windows printers, and several Direct Printers such as for Microcom, Datamax, and Monarch thermal printers for faster printing without the use of Windows drivers. Using Windows drivers, you can also use Eltron, Zebra, and other popular thermal and laser printers.
